

## Special Surfaces

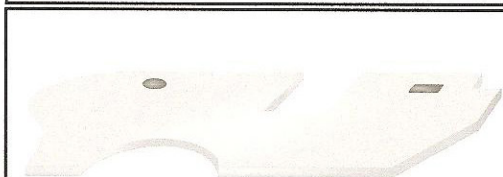

### Special Wedges

These special wedges are 75% larger than the regular ones available. The larger 22-5/8" diagonal width (versus the regular 17-3/8") is more comparable to the diagonal detail of a typical 48" x 24" corner work surface. This gives more clearance for the standard computer keyboard support tray and guide track. Wedges are a simple, cost effective solution for creating a corner workstation from two work surfaces at a 90° angle. Four heavy duty, zinc plated, flat steel support brackets are included and are pre-mounted on the wedge, for a quicker field installation. Several system finishes are in stock at **Dennis T. Kondo**, and are available for quick shipment, or pickup. Please call for current stock availability and discount pricing.

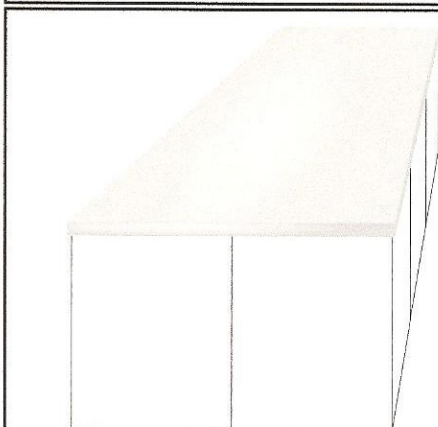

### Rounded Corner Transaction Surfaces

These special surfaces fit over 90°, 2-way connected panel assemblies. The outside rounded corner has a large 12" radius. This provides for a softer, safer design. The most common size is for a surface fitting on top of a 24" x 24" wide corner panel arrangement. However, these L-shaped Surfaces can be made to any system size, up to 144" x 60"! The long, transaction surface legs, on either side of the corner, provide additional panel stability, and an uninterrupted, continuous counter. They can be round, or square, ended. Standard and system finishes are available in plastic laminate and wood veneers. If all the transaction surfaces in a station are specified and ordered at the same time from **Dennis T. Kondo**, finish lot consistency will be strictly controlled in the DTK, Santa Ana Facility. Support hardware, as with other system transaction surfaces, are ordered separately.

### Modification of Surfaces

This is one of the services available, from **Dennis T. Kondo**. Width or depth cut downs, column cutouts or notchouts, modifications for angled walls, cockpit cutouts, cable and paper feed grommets, specified by the Customer, Designer or Installer, can all be completed, cleanly and precisely, to very tight tolerances, at the DTK, Santa Ana Facility.

### Large File Tops

These surfaces can be as big as 144" x 60", manufactured in *one* section, from **Dennis T. Kondo**. Standard and system finishes are available in plastic laminate and wood veneers. For tops that can be segmented, the overall size is unlimited. On the segmented tops, the joint edges are pre-mortised at the factory, to accept standard H-type, "tite-joint" connector drawbolts (included). This type of connector creates a tight, flat seam, that can still be disassembled, if necessary, at a later date for moving. It also allows the tops, at the seams, to sit flat on the file cabinets. Special cutouts or shaping, to fit around architectural columns, if specified by the Customer, can be done at the DTK, Santa Ana Facility. Vertical filler panels, cable grommets, and support hardware, to fit in any gaps next to the file cabinets, can also be provided. Please call if there are any questions.
